

ADDITIVO PRESERVANTE Code 770/21W

CHARACTERISTICS

Additivo Preservante 770/23W, is a biocide formulated for the protection of water based inks against fermentative phenomena.

INSTRUCTIONS FOR USE

Usually our inks are already protected against bacteria; however, as a precaution, in case of residuals of diluted ink, excess of paper dust in the working areas, long-time storage in particularly hot locations, the addition of 1% of this product (add about 200 gr of the additive in 20 Kg of ink) can be useful. Store the ink in closed cans.

If the ink has been already subjected to fermentation and it's malodorous, the addition of Additivo Preservante 770/21W, stops the bacterial action, but it doesn't remove odours. An addition of 1-2% of this product and positioning the ink in a ventilated area is suggested.

SECURITY DEVICES

In the handling of Additivo Preservante 770/21W, the use of normal precautionary measures for the use of chemical products (protective clothes, gloves and protective glasses) is needed. Avoid contact with skin, eyes and mucous membranes (look at the Material Safety Data Sheet). Don't keep on wearing clothes contaminated by this product.

TECHNICAL NOTES

Aspect: yellowish liquid solution
pH: 5.0-6.0

EXPIRY DATE AND STORAGE

The quality of the product is ensured for 12 months from the manufacture date with the product kept in the original sealed containers.
A storage temperature superior than 0°C is suggested.

STANDARD PACKAGINGS

Tanks 5-10-20 lt.

Vers. 01 of 01st February 2020

The aim of these technical data sheets is to inform the customers about our products, but they can not include all printing situations. For this reason the particularities of all printing processes must be considered before use of the described products and we suggest to contact us for further informations.
